Docker Support for Visual Studio Code

Docker Hub Azure Container Registry Azure PaaS Azure App Service

The screenshot shows the Visual Studio Code interface with the 'Extension: Docker' page open. The left sidebar displays a list of Docker-related extensions, including 'Docker', 'Docker Explorer', 'Docker Linter', 'Docker Runner', 'Docker Compose', 'Docker Workspace', 'Docker Extension Pack', 'Docker-IPython', 'docker-builder', 'Docker Registry Explorer', and 'Docker dive'. The main panel shows the details for the 'Docker' extension by Microsoft, which has 3,348,288 installs and a 5-star rating. It includes a 'Preview' badge and an 'Install' button. The extension description states it adds syntax highlighting, commands, hover tips, and linting for Dockerfile and dock... The 'Details' tab is selected, showing a 'Docker for Visual Studio Code (Preview)' section with a 'Visual Studio Marketplace v0.8.2' badge, 'installs 3.35M', and 'Azure Pipelines Succeeded'. Below this, there is a 'Prerequisites' section stating to install Docker on the machine and add it to the system path. A 'Features' section lists: Automatic Dockerfile, docker-compose.yml, and .dockerignore file generation; Syntax highlighting, hover tips, IntelliSense (completions) for docker-compose.yml and Dockerfile; Linting (errors and warnings) for Dockerfile files; and Command Palette (F1) integration for common Docker commands like docker build.

Visual Studio Code Kubernetes Tools

build passing

The extension for developers building applications to run in Kubernetes clusters and for DevOps staff troubleshooting Kubernetes applications.

Works with any Kubernetes anywhere (Azure, Minikube, AWS, GCP and more!).

Features include:

- View your clusters in an explorer tree view, and drill into workloads, services, pods and nodes.
- Browse Helm repos and install charts into your Kubernetes cluster.
- Intellisense for Kubernetes resources and Helm charts and templates.
- Edit Kubernetes resource manifests and apply them to your cluster.
- Build and run containers in your cluster from Dockerfiles in your project.
- View diffs of a resource's current state against the resource manifest in your Git repo
- Easily check out the Git commit corresponding to a deployed application.
- Run commands or start a shell within your application's pods.
- Get or follow logs and events from your clusters.
- Forward local ports to your application's pods.
